

04 – [theory of] EVOLUTION Learning Intentions

I understand that...	I can...	Mastery Check
4.1 – EVOLUTION OF LIFE		
<p>4.1.2 Evidence shows that life has existed on Earth for around 3.5 billion years, during which time it has diversified.</p>		
<p>4.1.3 Existing cells are the products of evolution.</p>		
<p>4.1.4 Membranes may have formed spontaneously and the first simple cells may have used RNA as genetic information. Ribozymes may have played a role in this development.</p>	<p><input checked="" type="checkbox"/> Describe the possible roles of RNA and ribozymes in the first simple cells.</p>	
<p>4.1.5 There is evidence that prokaryotic cells existed before eukaryotic cells.</p>	<p><input checked="" type="checkbox"/> Describe this evidence, including fossil evidence.</p> <p><input checked="" type="checkbox"/> Explain how the ancestry of most existing eukaryotic cells probably involved endosymbiotic events.</p>	
<p>4.1.6 Comparative genomics provides evidence for evolution and helps establish the likely evolutionary relationship between different species.</p>	<p><input checked="" type="checkbox"/> Describe the technique of DNA-DNA hybridisation.</p> <p><input checked="" type="checkbox"/> Describe how evidence from the following techniques may be used:</p> <ul style="list-style-type: none"> • DNA-DNA hybridisation • Sequencing of common proteins (e.g. cytochromes) • DNA sequencing including rRNA gene sequencing in prokaryotes. 	
<p>4.1.7 Phylogenetic tree diagrams represent evolutionary relationships.</p>	<p><input checked="" type="checkbox"/> Draw and analyse simple phylogenetic tree diagrams to represent evolutionary relationships.</p>	

I understand that...	I can...	Mastery Check
<p>4.1.8 Mutations accumulate over time. If the mutation rate is known, it can be used as a ‘clock’.</p>		
<p>4.1.9 More closely related species have fewer differences in their DNA sequences and have separated more recently from a common ancestor than distantly related species.</p>		
4.2 – REPRODUCTIVE ISOLATION MECHANISMS		
<p>4.2.1 Different criteria are used to define a species depending on the mode of reproduction.</p>		
<p>4.2.2 A species that reproduces sexually can be defined by the ability of its members to actually or potentially interbreed to produce fertile offspring.</p>		
<p>4.2.3 Other criteria used to define a species include:</p> <ul style="list-style-type: none"> • morphological similarity • biochemical similarity • sharing a common gene pool. 		
<p>4.2.4 Reproductive isolating mechanisms act to maintain distinct species.</p>	<p><input checked="" type="checkbox"/> Describe pre-zygotic (prevention of zygote formation) mechanisms including:</p> <ul style="list-style-type: none"> • temporal isolation • behavioural isolation • mechanical isolation • gamete isolation. <p><input checked="" type="checkbox"/> Describe post-zygotic (prevention of fertile hybrids) mechanisms including:</p> <ul style="list-style-type: none"> • hybrid inviability • hybrid sterility. 	

I understand that...	I can...	Mastery Check
4.3 – EVOLUTION AND NATURAL SELECTION		
<p>4.3.1 Mutation is a permanent change in the sequence of DNA nucleotides and is the ultimate source of genetic variation in a species.</p>		
<p>4.3.2 In a species that reproduces sexually there are additional sources of genetic variation.</p>	<p><input checked="" type="checkbox"/> Explain the sources of genetic variation in a species that reproduces sexually.</p>	
<p>4.3.3 A gene pool comprises all the genetic information in an interbreeding population.</p>	<p><input checked="" type="checkbox"/> Recognise that a large gene pool indicates considerable genetic diversity and is found in populations that are more likely to survive selection pressures.</p>	
<p>4.3.4 Natural selection is a process in which organisms that are better adapted to their environment are more likely to survive and produce offspring.</p>	<p><input checked="" type="checkbox"/> Explain how natural selection results in evolution by causing a change in the frequency of alleles in a population.</p>	
<p>4.3.5 Evolutionary changes are affected by other factors besides selection, including:</p> <ul style="list-style-type: none"> • sexual reproduction • genetic drift. 		
4.4 – SPECIATION		
<p>4.4.1 Speciation may result from an accumulation of genetic changes influenced by different selection pressures or genetic drift in geographically isolated populations.</p> <p>Different selection pressures may lead to divergent evolution or adaptive radiation.</p>	<p><input checked="" type="checkbox"/> Describe the process of allopatric speciation.</p> <p><input checked="" type="checkbox"/> Recognize and give examples of divergent evolution and adaptive radiation.</p>	
<p>4.4.2 Similar selection pressures on unrelated species may lead to convergent evolution.</p>	<p><input checked="" type="checkbox"/> Recognise and give examples of convergent evolution.</p>	

I understand that...	I can...	Mastery Check
<p>4.4.3 Succession is the gradual change in the mix of species in an area over time, following disturbance.</p>	<p><input checked="" type="checkbox"/> Describe the process of primary and secondary succession.</p>	
<p>4.4.4 Species or populations that have a reduced genetic diversity have a higher risk of extinction.</p>	<p><input checked="" type="checkbox"/> Give examples of species with low genetic diversity.</p>	
<p>4.5 – HUMAN IMPACT ON BIODIVERSITY</p>		
<p>4.5.1 Human activities can create new and significant selection pressures on a gene pool, leading to species extinction.</p>	<p><input checked="" type="checkbox"/> Describe how these activities have caused or may threaten the extinction of species.</p> <p><input checked="" type="checkbox"/> Give examples of human activities that lead to climate or environmental change.</p>	
<p>4.5.2 Maintaining biodiversity is an ethical issue with long-term biological and/or environmental consequences.</p>	<p><input checked="" type="checkbox"/> Recognise that humans have an obligation to prevent species extinction.</p>
